COLOUR BY NUMBERS

Tracking the way we use colour terms
with [Wordcount.org](https://www.wordcount.org)

Introduction

Our experience of colour ranges from the everyday to the almost incomprehensible, with numbers to match. Our eyes can identify several million distinct colours and there are thousands of terms to describe them in our language. However, in English we predominantly use just eleven basic colour terms and depending on whom you ask, there are three or four primary colours.

Of course we have no chance of representing the full range of our colour perception with three, four or eleven colour names and despite having a range of thousands within our reach, the basic terms are by far the ones most commonly used. The result of this is that many of us struggle to articulate and communicate the colours that we see. Of the numerous colour terms at our disposal, only a fraction are in widespread use.

Wordcount.org is an online resource and experiment created by Jonathan Harris in 2003, which tracks the way we use language. It ranks the 86,800 most frequently used words in English, the most common being 'the'. The data for the ranking is taken from the British National Corpus, a body of texts and spoken word samples collected to portray a true representation of how the English language is used today.

By using Wordcount as a research tool I have been able to highlight the ranking, and relative frequency of non-compound colour terms. Among the 86,800 words included in Wordcount, only 210 are colour terms, indicating just how rare many of the colour terms not included in the list, really are and how little they are used. This only goes to show how limited our colour vocabulary and our understanding of colour terms is, in comparison to what it could be.

With our language evolving ever more rapidly, is there a chance that colour terms which are rarely used or not well understood could become obsolete? And would our ability to precisely describe a particular shade or hue be lost too?
